

Drone B-Roll From One Photo

swipe →

ANANDA PARAMANICK

1

Capture Your Source Shot

Any smartphone photo in an outdoor location. Environmental context is what makes the AI motion look real.

Shoot wider than you think. AI needs surrounding environment to move the camera convincingly.

2

Upload to Higgsfield, Select Kling 2.6

Not the default model. Kling 2.6 handles camera movement more fluidly than earlier versions.

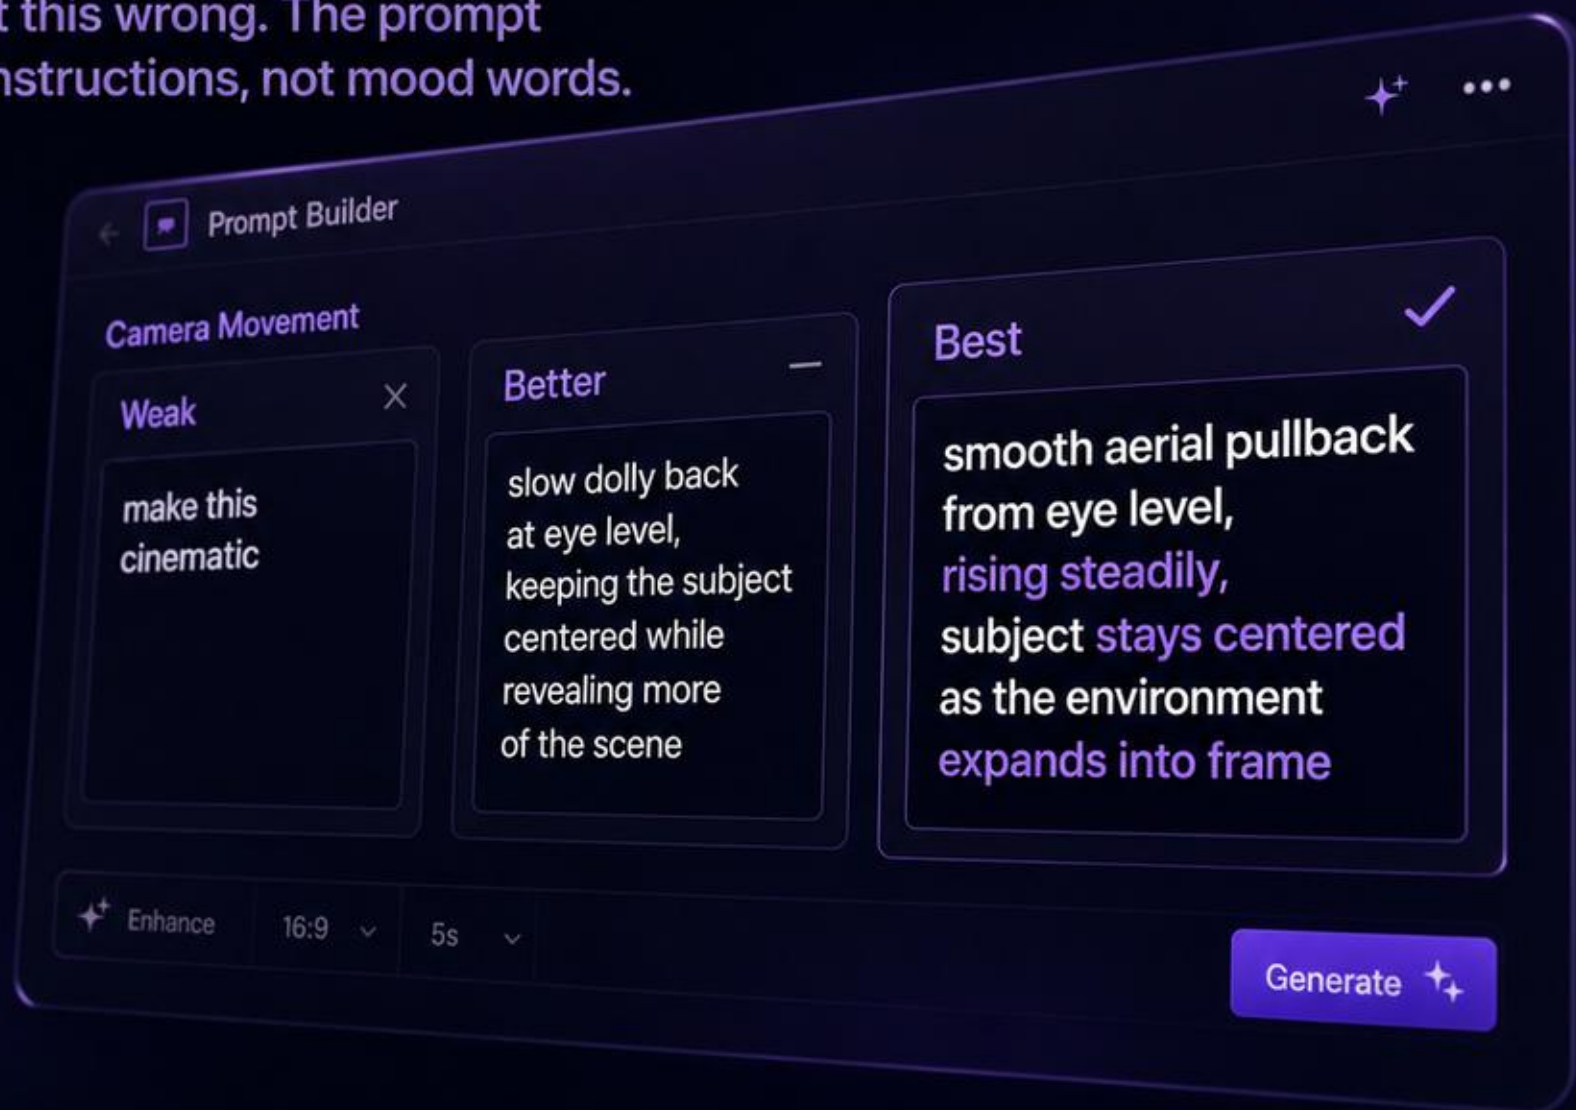

The model selection is the whole difference. Choose Kling 2.6 specifically.

3

Describe the Movement, Not the Vibe

Most people get this wrong. The prompt needs camera instructions, not mood words.

*Name the camera path. Name the direction.
Name what stays in frame.*

4

What You Get

Cinematic drone b-roll from a phone photo.
The same shot that costs \$300 to \$1,000
with an operator.

*If budget was the reason you
skipped aerial b-roll, that reason is gone.*

Save this.
