1

Two shots. One AI bridge.

Most editors think match cuts require precise in-camera choreography. Higgsfield with Kling 3.0 generates the connecting clip for you from just two screenshots.

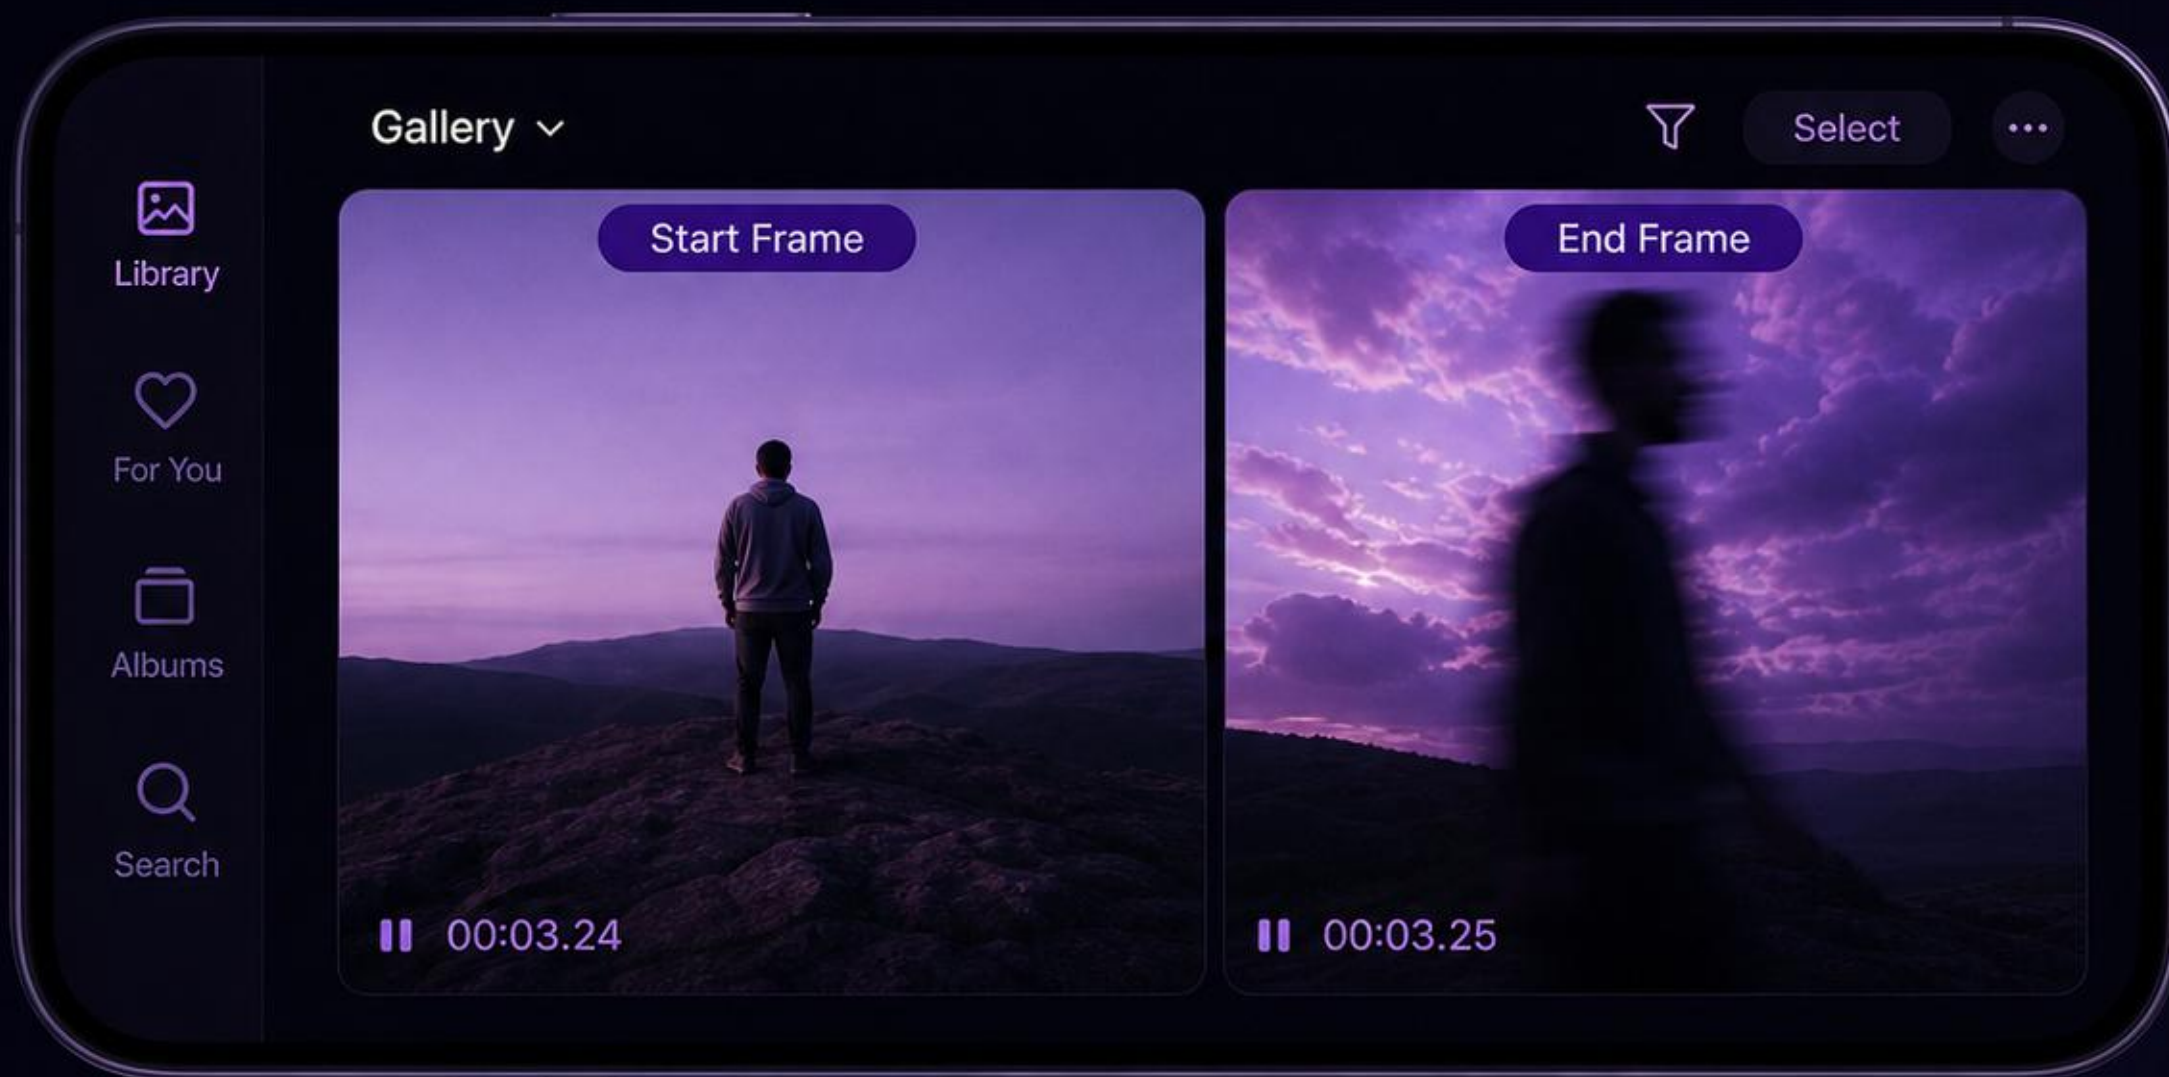

*Shoot your clips normally.
AI handles the transition between them.*

2

Screenshot the connecting frames

Pause clip 1 on its final frame before the action. Screenshot it. Pause clip 2 on its first frame after the action. Screenshot that too. These two images are your start frame and end frame.

*Two screenshots is all the input
Kling 3.0 needs to interpolate the movement.*

3

Load into Higgsfield, select Kling 3.0

In the image-to-video section, select Kling 3.0 as the model. Upload the first screenshot into the start frame slot and the second into the end frame slot.

 Generate

*Use Kling 3.0 specifically.
Earlier models handle frame-to-frame interpolation less accurately.*

4

Write the motion prompt.

Describe what physically moves between the two frames.

Keep it specific: what object moves, in which direction, at what speed.

Motion Prompt

Hand slides forward and grasps the product, smooth continuous motion from left frame toward right frame |

Describe movement not mood. Physical specifics produce better interpolation than vague directions.

5

Assemble the three clips

Drop clip 1 on the timeline, then the AI bridge clip, then clip 2. Trim the bridge clip to the exact frames you need. The cut is invisible.

*Three clips on the timeline.
One match cut that looks shot on set.*

Save this.

*Video editing techniques, AI tools,
and workflow breakdowns.*
